CA/Browser Forum Tracker

What Changed, 1 November to 8 November 2026

Last updated: 2026-11-08

About This Report

This is an experimental, AI-driven research project from SRL. SRL is independent, with no outside funding and no sponsors. This tracker is a summarized pull of the public record, kept as a coherent, concise news update. It draws on the CA/Browser Forum's own ballots, mailing lists and published documents, and on the public sources of the browser root programs. An AI model reads those sources and writes the summary, and every statement links to the source it came from. Where two sources disagree, both are reported. AI makes mistakes, so check the linked source before relying on any statement. The tracker is updated each week that the public record shows a change.

This update covers the CA/Browser Forum and the browser root programs from 1 November to 8 November 2026. It follows the 1 November update. The period is eight days long, and the report covers only what moved.

Section 1 names the story that still matters most, the eMudhra key compromise. Section 2 follows the Forum's ballots. Section 3 covers the root programs and the incident record. Section 4 covers transparency logs, revocation and the standards underneath. Section 5 closes with the picture as it stood on 1 November.

1. What Matters Most

The eMudhra story moved again, but the company's full account of the key compromise is still not public.

The full incident report on the key compromise was promised for 9 November, and it was not posted by 8 November [1]. On 2 November eMudhra asked for one more week and said it had appointed KPMG for an independent review [1]. The bug was assigned on 8 November, and its last change came on 6 November [1].

Chrome posted a notice on 4 November about the emSign Root CA - G1 root [2]. From 16 November, TLS certificates that chain to G1 lose default trust in Chrome 153 and later, when their earliest certificate timestamp falls after that date [2]. The notice says the change aims to coincide with Chrome 158 on 17 November [2]. The two version numbers are not reconciled in the source. Chrome's root store file, now at version 45, lists G1 among the constrained roots [3].

No other program has decided on G1 that could be found. Mozilla, Apple and Microsoft showed no statement on the root in the window [1] [4]. Netlock's removal from the Mozilla root store is under discussion, but the thread records a proposal and no decision [13].

2. The Forum’s Ballots

A ballot passes through discussion, a seven-day vote, a thirty-day intellectual property review and publication, and only the last step makes it a rule.

Recent Developments

SC105 entered its intellectual property review on 2 November [49]. The review runs to 2 December at 11:00 UTC, and the 5 November agenda gives the same end date [50]. The Extended Validation Guidelines stay at version 2.0.4 until the ballot is published [39].

SC-107, on certificate problem reports and the meaning of revocation, opened a new discussion period on 5 November [24]. Its discussion may not close before 16 November [24]. One reply on the thread says the sender cannot support the ballot “in its current state”. The snippet is partial, and the sender is not confirmed [24]. The redline, pull request 622, is open with 65 commits and no approvals [25].

The post-quantum ballot SC-106 is now off the working group’s tracking list. The 22 October minutes, posted on 5 November, say the draft will be removed from the list, and that discussion may move to the Client Authentication working group [26]. The ballot is absent from the ballots page and from the 5 November agenda, and no successor draft was found [38] [50].

The S/MIME working group opened PR 311 on 3 November to clarify scope [43]. Its PR 310, the ballot formerly known as SMC019, was retitled on the same day and now adds ML-KEM [43]. The 4 November agenda also lists an open ballot to confirm a new S/MIME vice chair [30]. The leadership page names a different vice chair with a term ending 30 November, so the change is unresolved [33].

A draft charter for a new Entity Authentication working group was posted to the public list on 6 November [32]. The post names no chairs, and no ballot date is visible [32].

Current State

Nothing has been published, so no rule changed in the window. The Baseline Requirements stay at version 2.3.1 [36], and the server certificate repository has no tag for a later version [37]. The Extended Validation Guidelines stay at 2.0.4 [39], and the code signing requirements stay at 3.11.0 [28].

Four ballots are in intellectual property review. SC105 runs to 2 December [49]. CSC-034 runs to 26 November with no exclusion notice [27]. SMC020 runs to 19 November, and the 4 November S/MIME agenda shows the same date [30]. NS-010 version 2 runs to 13 November, with no network security post since 14 October [51] [12].

The code signing ballot CSC-033 has no clear public stage. The tracker’s discussion end of 2 June does not match the archive, whose discussion thread is dated 8 June [29]. No vote, failure or withdrawal notice exists in the record, so its state stays unresolved [29].

The Forum’s intellectual property policy is still version 1.4 [34]. The bylaws page refers to version 2.5 without giving an effective date, so whether that version is in force is not settled from the page text [35].

On validation, a proposal opened on 29 October would combine the TLS Baseline Requirements' Reliable Data Source definition with the Extended Validation Guidelines' QIIS and QGIS concepts [31]. One participant answered that the change should go into the Baseline Requirements first, with the guidelines referring to it [31]. The Validation Subcommittee's 29 October agenda still lists SC-107 as in discussion, and no validation minutes have been posted since 23 July [31].

3. Root Programs and Incidents

Most of the week's incident traffic is closures and filings, and only a few items change what a root program must do.

Recent Developments

Microsoft PKI Services filed its full incident report on 6 November [5]. A user-agent filter had blocked the certificate revocation list on a Microsoft site, and Microsoft marked its own action to remove the filter as complete [5] [14].

eMudhra's closure summary for the delegated responder bug says 87 responder certificates issued after 15 September 2023 carried the revocation distribution point extension [6]. All 41 unexpired ones were revoked on 14 October, and eMudhra requested closure on 8 November [6].

The CCADB incident reporting team proposed closing the KIR bug as invalid on or about 9 November [7]. The nextUpdate field was exactly twelve calendar months after thisUpdate, and the team said this "does not establish a violation" [7]. Sectigo's closure request, on a user-agent block at its CRL host, is expected to close on or about 12 November [8].

D-Trust posted its full report on a backup and recovery testing finding on 4 November [9]. Its linked vulnerability-management finding moved its next update from 5 to 9 November [10].

Several new bugs were filed in the window. TWCA reported jurisdiction fields that do not match the registration level, and a serial number carrying 63 bits of random output instead of 64 [14] [15]. SECOM, Atos, NETLOCK, Sectigo, D-Trust and SSL.com reported further issues, all assigned [14] [15]. Buypass, GlobalSign and DigiCert filed reports that remain unconfirmed [15].

A new eMudhra bug, filed on 6 November, says the Series A intermediates were missing from the 2024 and 2025 audit reports [12]. It is unconfirmed [12]. HARICA's bug reports two truncated CRLs after a disk-space exhaustion, with a full report expected on 11 November [11].

Current State

Apple's draft policy for Merkle tree certificates is still unpublished. Apple said on 30 October that it would publish "as soon as we can", and no later message appears [16]. The Chrome post-quantum root program draft has no new version since 28 October [48].

Microsoft's trusted root release-notes page still lists no 2026 deployment notice [4]. The CCADB policy has no newer version than 2.1 [17].

4. Transparency, Revocation and Standards

The transparency logs, the revocation fixes and the post-quantum RFCs all moved this week, and the dates on some of them still need confirming.

Recent Developments

Chrome's log list moved to version 96.3 on 7 November [18]. It lists 89 logs from 11 operators, and four TrustAsia logs are marked qualified with state timestamps of 3 November [18].

Apple announced a version 1.1 of its certificate transparency policy and log program on 5 November [19] [40]. Apple's own pages do not yet show that version, and the thread body was not readable [20]. A 6 November post on Google's RFC 6962 log deprecation is readable only as a preview [40]. The preview says Apple removed a requirement for one RFC 6962 timestamp, but no Apple text confirms that [40].

Let's Encrypt planned a production run with seven validation perspectives for 10 November, subject to staging going well [21]. The five-perspective rule in the Baseline Requirements takes effect on 15 December [21]. No delay has been posted [21].

Two RFCs on composite post-quantum signatures are now published as Proposed Standards. RFC 10073 covers X.509 certificates, and RFC 10082 covers the Cryptographic Message Syntax [22] [23]. Their datatracker histories date the publication to 6 and 7 November, and the RFC Editor pages give only the month, November 2026 [22] [23].

The attestation draft for certificate signing requests moved to "Revised I-D Needed" on 5 November, after discuss positions from 2 to 4 November [47]. A PLANTS draft on Merkle tree certificates reached revision 08 on 1 November [46].

The TLS ML-KEM and ML-DSA drafts have no RFC number yet, and the RFC Editor queue page did not load [44]. RFC 5280 erratum 9259 was reported on 1 November, and its status is "reported" and not verified [45].

Current State

The audit regimes are unchanged. No new ETSI, WebTrust or ACAB'c document appeared in the window [41] [42]. The WebTrust base-criteria version is unresolved: the CPA Canada page lists version 2.2.1 where the repository records 2.2.2 [52].

D-Trust's audit findings remain the open audit items [9] [10].

5. Where Things Stood on 1 November

The eMudhra key compromise was the main story. Chrome, Microsoft and Edge had removed several of its roots, and the full incident report had not been posted. Two ballots had passed their votes, and SC105 and CSC-034 were in review.

The Baseline Requirements stood at version 2.3.1, and the Extended Validation Guidelines at 2.0.4. The post-quantum ballot SC-106 had no live text, and SC-107 was still in discussion. No composite-signature RFC had been published, and Chrome's log list was at version 95.19.
