

Latest in AI Music Creation -- diff report

Generated: 2026-09-01T07:27:27.008232 | **Period:** since 2026-09-01 | **Leaves with news:** 1 of 1

Fresh developments: 10 (as_of within 14 days of the window) | **Superseded/conflicting:** 12 | **Background captured:** 22 (older material, first time in the knowledge base)

Reconfirmations in this period (no new information, not shown): 2.

Summary

Leaf	Fresh	Superseded	Conflicting	Background
AI-assisted production tools	10	9	3	22

AI-assisted production tools

AI-assisted production tools (ai-assisted-production-tools)

New developments (10)

Ableton Live 12.4 — stem separation gets usable

- Stem separation in Live offers a High Speed and a High Quality mode, and uses the GPU on Apple silicon Macs while Intel Macs and Windows machines process on the CPU. ([help.ableton.com — 23730994755996 Stem Separation in Ableton Live FAQ](#), as of 2026-09-01, confidence: medium, source: ingest)
- *New processing-mode and hardware-acceleration detail for Ableton's Stem Separation not previously recorded.*

Corrections — mastering

- Splice's mastering presence is a marketplace one: it rents iZotope's Ozone and LANDR's mastering plugin to subscribers on a rent-to-own basis rather than operating a mastering engine of its own. ([landr.com — press landr on splice](#), as of 2026-09-01, confidence: medium, source: ingest)
- *Adds the rent-to-own marketplace mechanism detail for Splice's mastering-plugin rentals not previously recorded.*
- Ozone 12 is compatible with Logic Pro 10.8 to 11, Pro Tools 2024 to 2025, Ableton Live 12, Cubase 14, Nuendo 14, Studio One 7, Reaper 7, FL Studio 24 to 25, Reason 13, Audition CC 2025, Premiere Pro CC 2025 and Maschine 3, and requires macOS Ventura or later. ([izotope.com — ozone advanced](#), as of 2026-09-01, confidence: medium, source: ingest)
- *Adds additional supported hosts (Nuendo, Audition, Premiere Pro, Maschine) and the macOS Ventura requirement not previously listed.*
- eMastered's reference mastering analyses an uploaded reference file and applies its loudness, balance and compression characteristics to the user's track, exposing Reference Amount and Reference Intensity as expert controls and allowing mastering settings to be saved as reusable presets. ([help.emastered.com — 5572626314637 Reference Mastering](#), as of 2026-09-01, confidence: medium, source: ingest)
- *Adds specific control names and preset-saving detail for eMastered's reference mastering not previously recorded.*
- Spotify's own artist documentation states loudness normalization targets -14 LUFS per ITU-R BS.1770 methodology and reserves about 1 dB of headroom for lossy encoding, so tracks with higher true-peak

maximums are turned down less than tracks with more peak headroom. ([support.spotify.com — loudness normalization](https://support.spotify.com/uk/faq/music/loudness-normalization/), as of 2026-09-01, confidence: medium, source: ingest)

- *Adds the ITU-R BS.1770 standard reference and the lossy-encoding headroom mechanism, detail beyond the base's bare -14 LUFS figure.*

Corrections — stem separation

- LALAL.AI's Orion network currently supports seven stems and the company states it is expanding that list toward ten, with its older Phoenix network covering piano, drums, bass, the two guitars, synthesizer, and wind and string instruments. ([lalal.ai — orion new neural network](https://lalal.ai/orion-new-neural-network/), as of 2026-09-01, confidence: medium, source: ingest)
- *New per-engine stem breakdown (Orion vs Phoenix) not previously distinguished in the base's general '10 source types' claim.*
- Meta's original Demucs repository is no longer maintained and development continues in the author's fork, where htdemucs is the first Hybrid Transformer Demucs generation and htdemucs_ft is a fine-tuned variant that takes about four times as long to separate. ([github.com — demucs](https://github.com/facebookresearch/demucs), as of 2026-09-01, confidence: medium, source: ingest)
- *New maintenance-status and performance-cost detail for htdemucs_ft not previously recorded.*
- Ultimate Vocal Remover's GUI runs three separate architectures — the VR Architecture originally written by tsurumeso, MDX-Net from Kuailab and Woosung Choi, and Demucs from Défossez — each contributed by different authors and credited in the project's own README. ([github.com — ultimatevocalremovergui](https://github.com/UltimateVocalRemover/ultimatevocalremovergui), as of 2026-09-01, confidence: medium, source: ingest)
- *Adds original-author attribution for UVR's three bundled architectures, a detail not present in the existing description.*

Governance

- The Principles for Music Creation with AI initiative maintains a standing public home under the AI For Music banner rather than existing only as a launch announcement. (aiformusic.info, as of 2026-09-01, confidence: medium, source: ingest)
- *New information about the initiative's ongoing public presence, not previously recorded.*

in-DAW assistants and generators

- Suno launched Suno Studio, a generative audio workstation that consolidates creation tools into one product allowing users to generate individual stems, arrange and edit them on a multi-track timeline, start from audio sources like samples or hummed melodies, and export projects as audio and MIDI. ([AI music company Suno launches Suno Studio, a 'generative audio workstation' – DailySynapse](https://www.daily-synapse.com/news/al-music-company-suno-launches-suno-studio-a-generative-audio-workstation/), as of 2026-09-01, confidence: high, source: grok)
- *Genuinely new generative-workstation product with no prior entry in the base.*

Superseded (9)

Ableton Live 12.4 — stem separation gets usable

- Live 12.4 improved Stem Separation in four ways: only the audible portion of a file is processed, a selected portion of a clip can be separated in Arrangement View rather than the whole file, separated stems can be merged back to a single track, and progress is reported by one unified bar instead of per stem. ([help.ableton.com — 26963870210076 What s new in Live 12 4](https://help.ableton.com/en/articles/26963870210076-What-s-new-in-Live-12-4), as of 2026-05-06, confidence: medium, source: ingest)
- supersedes: ""Ableton Live 12.4 (released May 2026) added support for performing stem separation on specific time selections within clips in Arrangement View, along with a merge-to-single-track option and unified progress bar.""

- Ableton's own help documentation gives the complete, authoritative list of four Live 12.4 stem-separation improvements, adding the 'audible portion only' detail missing from the earlier blog report.

Corrections — mastering

- LANDR's own mastering pricing page lists unlimited masters at \$9.99 per month, and LANDR Studio, the bundle that adds samples and distribution, starts at \$12.50 per month. ([landr.com — master](#), as of 2026-09-01, confidence: medium, source: ingest)
- supersedes: "[b1:25] \"LANDR is a cloud-based AI mastering service priced around \$12.99/month that offers unlimited MP3 masters\""
- *LANDR's own pricing page confirms the baseline-grounded \$9.99/month figure, correcting the base's \$12.99 figure, and adds the new LANDR Studio bundle price.*
- Splice's 2026 generative AI release consisted of three sample-manipulation tools announced on 15 April 2026 — Variations, Craft and Magic Fit — under a model that compensates the original sample creator each time a sound is used as a source or a variation is downloaded. Splice did not launch a mastering service. ([musicbusinessworldwide.com — splice launches ai tools that compensate sample creators when their sounds are used](#), as of 2026-04-15, confidence: medium, source: ingest)
- supersedes: "[b1:29] \"Splice launched its own AI mastering service, Splice Mastering, in 2025; it is well-integrated for existing Splice sample users and its quality is considered competitive with LANDR.\""
- *Per baseline grounding, there is no product called 'Splice Mastering'; this source corrects the record with Splice's actual 2026 release (Variations, Craft, Magic Fit).*

Corrections — stem separation

- LALAL.AI's VST plugin reached seven stems on 21 May 2026 — vocals, instrumental, drums, bass, acoustic guitar, electric guitar and piano — with all processing performed locally on the user's machine. ([lalal.ai — lalal ai releases six stem vst plugin and local processing in the desktop app](#), as of 2026-05-21, confidence: medium, source: ingest)
- supersedes: "[d0001:9] \"By late April 2026 the plugin was expanded to six-stem local separation (vocals/instrumental, bass, drums, acoustic guitar, electric guitar, piano), still via Lyra, still fully offline.\""
- *Per baseline grounding, the seven-stem 21 May 2026 figure is the correct current state, superseding the earlier six-stem/April figure.*
- RipX DAW is priced at \$99 and RipX DAW PRO at \$198 as one-time purchases on Hit'n'Mix's own store. ([buy.hitnmix.com](#), as of 2026-09-01, confidence: medium, source: ingest)
- supersedes: "[b1:17] \"RipX DAW is a one-time-purchase consumer tool (\$60–\$160, with a Pro tier for full stem editing)\""
- *Current pricing taken directly from the seller's own store supersedes the base's vaguer price range, per the evidence bar for vendor pricing.*

Corrections — the survey figure

- In Sonarworks' survey the 60% figure applies specifically to using AI as an ideation tool for melodies, chord progressions and arrangement ideas. Adoption by category is lower and varies: audio restoration 58%, mixing assistants 38%, mastering 33.9% and composition 20.9%, with about 30% using AI as a co-producer and 5% delegating full production to it. ([sonarworks.com — future music production human producer survey 2026](#), as of undated, confidence: low, source: ingest)
- supersedes: "[b1:1] \"more than 60% now use AI tools for ideation, audio cleanup, stem separation, and mixing assistance\""
- *Corrects the base's single blended 60% figure by showing it applies only to ideation, with materially lower adoption rates for mixing, mastering and composition specifically.*

FL Studio — Gopher, in two distinct releases

- Gopher shipped first in FL Studio 2025 as an assistant that answered production questions, and in FL Studio 2026 it became able to act inside a project: organising tracks, setting levels, routing audio, and generating Piano roll and VFX scripts on demand. Image-Line labels the control capability experimental. ([image-line.com — 2026](#), as of 2026-07-07, confidence: medium, source: ingest)
- supersedes: "[b1:7] "FL Studio has added a chatbot-style agentic AI assistant called Gopher that can be controlled from inside the DAW, and separately received a browser-accessible beta called FL Studio Web at the end of 2025.""
- *Clarifies and corrects the base's merged/ambiguous account by cleanly separating the FL Studio 2025 advice-chatbot Gopher from the FL Studio 2026 agentic Gopher, per the baseline instruction not to merge the two releases.*

Logic Pro 12 — the release the base missed entirely

- Session Players — Drummer, Bass Player and Keyboard Player — are an Apple Logic Pro feature, documented by Apple in the Logic Pro user guide. They are not an Ableton Live feature, and Ableton ships nothing under that name. ([support.apple.com — mac](#), as of 2026-09-01, confidence: medium, source: ingest)
- supersedes: "[b1:3] "Ableton Live 12's AI Session Players lineup includes Drummer, Bass Player, and Keyboard Player, with a Synth Player added in version 12""
- *Apple's own documentation confirms Session Players belong to Logic Pro, correcting the base's false Ableton attribution per the baseline grounding.*

stem separation

- LALAL.AI's Andromeda cloud model added a new Guitars stem (capturing acoustic or electric guitars in one file) and a rebuilt Piano model with cleaner separation. ([Blog | LALAL.AI | All Things Music and AI](#), as of 2026-08-27, confidence: medium, source: grok)
- supersedes: ""LALAL.AI introduced the Andromeda neural network model in May 2026, expanding cloud-based separation to four stems (vocals, instrumental, drums, bass)""
- *Andromeda's stem count expanded beyond the original four (vocals, instrumental, drums, bass) with the addition of Guitars and a rebuilt Piano model.*

Conflicting -- needs review (3)

Corrections — mastering

- Ozone 12 Advanced carries 20 editable mastering modules that can load individually in a DAW, three add-on plugins and the Stem Focus workflow, while Standard carries 14 modules that load only inside the Ozone mothership plugin and Elements carries Master Assistant with no individual module access. ([izotope.com — ozone advanced](#), as of 2026-09-01, confidence: medium, source: ingest)
- conflicts with: "[b1:23] "Advanced (\$499, including 21 individual plugins)""
- *20 modules plus 3 add-ons does not cleanly match the base's '21 individual plugins' figure for Ozone 12 Advanced, a discrepancy needing human resolution rather than silent replacement.*

Corrections — stem separation

- LALAL.AI bills in processing minutes rather than credit packs, and stem separation multiplies the file length by the number of stem types selected, so a four-stem split consumes roughly four times the minutes of a vocal-only split. ([lalal.ai — faq](#), as of 2026-09-01, confidence: medium, source: ingest)
- conflicts with: "[b1:15] "LALAL.AI runs its Phoenix and Orion engines with per-credit pricing from \$10 to \$100 per pack... per-stem billing means a 4-stem separation costs roughly 4x a vocal-only separation""
- *This source describes billing in processing minutes rather than the credit-pack model in the base, a direct disagreement on the billing mechanism that needs human resolution.*
- Fender Studio Pro 8.1's Moises allotment — 10 AI audio separations, 120 stem generation credits amounting

to about 60 minutes, and 5 voice conversions per month — is what users on the free Moises tier receive, and the Studio Assistant introduced in the same release is available to Pro+ subscribers. ([fender.com — fender studio pro integrations](#), as of 2026-06-09, confidence: medium, source: ingest)

- conflicts with: "[d0001:10] "giving all 8.1 users a monthly allotment of 10 stem separations, 120 stem-generation minutes, and 5 voice conversions at no extra cost""
- *This source converts the same 120 credits into roughly 60 minutes rather than 120 minutes, a numeric disagreement with the established figure that needs resolution rather than silent overwrite.*

Newly captured background -- older material, first time in the knowledge base (22)

Ableton Live 12.4 — stem separation gets usable

- Ableton released Live 12.4 in May 2026 as a free update for Live 12 users, ahead of Superbooth 2026, with Link Audio as the headline addition. ([ableton.com — live 12 4 is out now](#), as of 2026-05-06, confidence: medium, source: ingest)
- *Provides release-timing and free-update context for the Live 12.4 stem-separation improvements not previously recorded.*

Corrections — mastering

- CloudBounce ceased trading on 1 April 2025 and no longer operates as an independent mastering service. Image-Line, its parent, carried the underlying technology into FL Studio's AI Mastering and FL Cloud, and offered CloudBounce customers a perpetual FL Studio Fruity Edition licence. ([yourvst.com — cloudbounce have stopped trading](#), as of 2025-04-01, confidence: medium, source: ingest)
- *Adds new detail (FL Studio AI Mastering destination, perpetual Fruity Edition licence offer) beyond the baseline's bare closure fact.*
- CD Baby ended its CloudBounce mastering partnership on 27 February 2025, with previously mastered files remaining available to customers only through February 2026. ([support.cdbaby.com — 360027082911 CloudBounce Audio Mastering Legacy](#), as of 2025-02-27, confidence: medium, source: ingest)
- *New fact about a specific third-party partnership wind-down not previously recorded.*

Corrections — stem separation

- The LALAL.AI plugin runs on Lyra, a model built for local deployment with GPU and NPU acceleration, is available to Pro subscribers as VST3 on Windows, macOS and Linux with AU in beta, and runs fully offline after activation apart from occasional subscription checks. ([lalal.ai — lyra local stem separation in lalalai desktop app and vst plugin](#), as of 2026-05-21, confidence: medium, source: ingest)
- *New platform, licensing tier and offline-operation detail for the Lyra-powered plugin not previously recorded.*
- BS-RoFormer, the band-split RoPE transformer, took first place in the music separation track of the Sound Demixing Challenge 2023 and reaches 9.80 dB average SDR on MUSDB18HQ without extra training data. ([arxiv.org — 2309.02612](#), as of 2023-09-06, confidence: medium, source: ingest)
- *New quantitative benchmark detail (SDC 2023 win, 9.80 dB SDR) for BS-RoFormer not previously recorded.*
- Mel-RoFormer maps frequency bins into overlapping mel-scale subbands rather than the non-overlapping heuristic bands of BS-RoFormer, and outperforms it on vocals, drums and other stems on MUSDB18HQ. ([arxiv.org — 2310.01809](#), as of 2023-10-03, confidence: medium, source: ingest)
- *New architectural and comparative-performance detail for Mel-RoFormer not previously recorded.*

Corrections — the survey figure

- Sonarworks' 2026 producer survey covered 1,194 creators, more than 70% of whom are working professionals with over a decade of experience. ([sonarworks.com — future music production human producer survey 2026](#), as of undated, confidence: low, source: ingest)
- *Adds a new demographic breakdown (professional tenure) of the survey population not present in the base's*

bare respondent count.

- Asked how they see AI developing, 57.9% of Sonarworks-surveyed producers described it as a tool, 20.6% expected major automation under human oversight, 8.8% expected full automation, 5.1% expected minimal impact and 7.6% were unsure. ([sonarworks.com — future music production human producer survey 2026](#), as of undated, confidence: low, source: ingest)
- *New sentiment/outlook data from the same survey not previously recorded in the base.*

FL Studio — Gopher, in two distinct releases

- Image-Line released FL Studio 2026 on 7 July 2026, free to existing owners under its Lifetime Free Updates policy. ([image-line.com — 2026](#), as of 2026-07-07, confidence: medium, source: ingest)
- *Adds the specific release date and Lifetime Free Updates pricing policy for FL Studio 2026, absent from the base's vague Gopher description.*
- FL Studio 2026 also rebuilt the FLEX plugin from the ground up and expanded FL Cloud with an improved Loop Starter, automatic project backup and additional premium plugins. ([image-line.com — 2026](#), as of 2026-07-07, confidence: medium, source: ingest)
- *New FL Studio 2026 feature details (FLEX rebuild, FL Cloud expansion) not previously recorded alongside the Gopher release.*

Governance

- Universal Music Group and Roland Corporation published the "Principles for Music Creation with AI" in March 2024, a set of seven principles on responsible AI use in music, and a coalition of more than 50 music technology organisations — including LANDR, Splice, Native Instruments, Focusrite, Output, Waves, Eventide, BandLab Technologies, Beatport and NAMM — subsequently signed on in support. ([musicbusinessworldwide.com — over 50 music companies join roland and universal in campaign to promote musicians amid generative ai growth](#), as of 2024-06-25, confidence: medium, source: ingest)
- *Adds the original March 2024 publication date, the seven-principle framing, and specific named signatories beyond the base's undated general mention of the pledge.*
- Image-Line paired the FL Studio 2026 Gopher release with an explicit commitment that neither cloud projects nor Gopher sessions are used to train AI models. ([image-line.com — 2026](#), as of 2026-07-07, confidence: medium, source: ingest)
- *New vendor governance commitment tied to Gopher's agentic release, not previously recorded.*

Logic Pro 12 — the release the base missed entirely

- Apple released Logic Pro 12 for Mac and iPad in January 2026 as part of the Apple Creator Studio launch, introducing Synth Player and Chord ID as its headline intelligent features. ([apple.com — introducing apple creator studio an inspiring collection of creative apps](#), as of 2026-01-30, confidence: medium, source: ingest)
- *Adds the Apple Creator Studio launch framing and Chord ID as a co-headline feature, not previously recorded.*
- Synth Player is the fourth AI Session Player in Logic Pro, joining Drummer, Bass Player and Keyboard Player, and generates chordal and synth bass performances including 808 Bass, Pump Bass and Sequenced Bass styles under complexity and intensity controls. ([support.apple.com — 109503](#), as of 2026-01-30, confidence: medium, source: ingest)
- *Adds specific Synth Player style names and control detail not previously recorded.*
- Chord ID analyses harmonic content from audio or MIDI regions and populates the Logic Pro chord track automatically, and because the chord track drives every AI Session Player, an identified progression can be re-performed by any of them. ([apple.com — introducing apple creator studio an inspiring collection of creative apps](#), as of 2026-01-30, confidence: medium, source: ingest)
- *New feature (Chord ID) and its interaction with Session Players, not present in the base.*
- Logic Pro 12 is the first version of Logic Pro that does not support Intel Macs, requiring Apple silicon. ([support.apple.com — 109503](#), as of 2026-01-30, confidence: medium, source: ingest)
- *New system-requirement fact about Logic Pro 12 not previously recorded.*

- Apple updated Apple Creator Studio again in June 2026, carrying further changes across the creative app collection that includes Logic Pro. ([apple.com — apple creator studio gets smarter faster and more connected](#), as of 2026-06-30, confidence: medium, source: ingest)
- *Records a follow-on Apple Creator Studio update touching Logic Pro not previously known, even though details are thin.*

in-DAW assistants and generators

- Logic Pro 12 (released January 2026) added Synth Player to the AI Session Players lineup, enabling dynamic synthesizer performances with controls for styles like Simple Pad and Synth Bass. ([Apple Releases Logic Pro 12 for Mac and iPad with AI-Powered Session Players](#), as of 2026-01-28, confidence: high, source: grok)
- *New product/feature not in base: correctly attributes the Synth Player addition to Logic Pro 12 rather than Ableton.*

separation/mastering model research

- A March 2026 arXiv paper (arXiv:2603.04032) describes a multi-stage curriculum using BS-RoFormer for 8-stem separation (plus auxiliary other) with LoRA fine-tuning from 4-stem checkpoints. ([Multi-Stage Music Source Restoration with BandSplit-RoFormer Separation and HiFi++ GAN](#), as of 2026-03-04, confidence: high, source: grok)
- *New research extension of the BS-RoFormer frontier architecture not previously recorded.*

stem separation

- Ableton Live 12.4 (released May 2026) added support for performing stem separation on specific time selections within clips in Arrangement View, along with a merge-to-single-track option and unified progress bar. ([Ableton Live 12.4 Is Out — Here's What Changed With Stem Separation, Erosion, Delay and More](#), as of 2026-05-05, confidence: high, source: grok)
- *New Live 12.4 stem-separation workflow improvements not present in the base's Live 12.3 description.*
- LANDR upgraded its Stems plugin in April 2026 with AudioShake's next-generation models, adding dedicated piano and guitar stem separation (in addition to vocals, drums, bass, other) for cleaner isolation inside the DAW. ([LANDR Adds Next-Generation Stems from AudioShake, Introducing with Piano and Guitar Separation](#), as of 2026-04-15, confidence: high, source: grok)
- *New information about LANDR's separate Stems plugin (distinct from the \$299 LANDR Mastering plugin already recorded), with a new AudioShake-powered model and added stems.*
- LALAL.AI introduced the Andromeda neural network model in May 2026, expanding cloud-based separation to four stems (vocals, instrumental, drums, bass) with improved quality and frequency handling for bass. ([Meet LALAL.AI Andromeda: Next Gen of Audio Source Separation](#), as of 2026-05-04, confidence: high, source: grok)
- *New cloud-model launch (Andromeda) distinct from the local Lyra VST plugin already established in the base.*
